

There Is No Substitute for Industry Knowledge.

In 1982 TISCOR began developing equipment inspection software for hand-held computers. As an industry pioneer, we've developed expertise that is relevant to your business needs. We're here to help you solve the specific inspection challenges you face every day.

Top Ten Reasons Customers Use InspectNTrack

1. **Access your data anytime, anywhere.**
2. **InspectNTrack provides 100% accountability.** The system provides documented proof of all activities. Inspections are valid and on-time, and missed inspections are completely eliminated.
3. **Reports provide unlimited visibility.** You know what is due, what is overdue, and what is coming due in the future. You can filter by daily activity, exceptions, incidents, technicians, and much more.
4. **Administrative data entry at the PC is eliminated.** Routes are transferred from the PC directly to the Pocket PC device, providing the technician with all needed inspection information. Upon completion of the inspection routes, the information is transferred back to the PC and stored in history.
5. **Risk and liability are mitigated.** InspectNTrack helps protect your most important assets: products, premises and people. A documented inspection program reduces the chances of equipment failure, minimizing both risk and liability.
6. **Always prepared and audit-ready.** Inspection history is easily accessed and filtered, so retrieving information during an audit is quick and easy and provides accurate information.
7. **Eliminates missed inspections.** Information on missed equipment is provided on the Pocket PC device while you are in the field. That means that there is no need to go back into the field because an inspection was missed. During a route, the Pocket PC device will display how many locations/pieces of equipment you have visited and how many are left to visit. If you choose to exit the route, it will remind you that you have not completed the inspections.
8. **Accurately track moveable equipment,** such as fire extinguishers. The system will automatically change the location of a piece of equipment, eliminating the need to return a piece of equipment to its original location. All inspection history remains intact.
9. **The InspectNTrack database is robust enough to handle an unlimited amount of equipment.** It is built to accommodate your internal business processes, while at the same time providing information that stands up to any AHJ inspection.
10. **User-based Product Development.** TISCOR's product roadmap is based on feedback from our customers. Each year, a User Group meeting is held to gather information and discuss the future of the product.
